Supported by the

The Hawley Award for Engineering Innovation

A £5000 prize for Engineering Innovation that benefits the Environment

Applications are invited for The Hawley Award, which was established in 2006, and is awarded annually for the most outstanding Engineering Innovation that delivers demonstrable benefit to the environment. **The revised deadline for the 2016 Award is Wednesday 18 May 2016.**

The award is made by The Engineers Trust (www.engineerstrust.org.uk) the Trust Fund of the Worshipful Company of Engineers, a Livery Company of the City of London (www.engineerscompany.org.uk)

To be eligible for the award, the application must be made by:

- A candidate who is resident in the UK and a graduate or more senior member of a recognised Engineering Institution.
- Is an early career stage engineer or scientist, in academia or industry, typically within 10 years of starting a professional career.
- An individual candidate who has personally produced an engineering innovation. Exceptionally, a small team may be considered where the innovation has a highly multi-disciplinary nature.

The Innovation will:

- Have demonstrable benefits for the Environment.
- Arise from work undertaken after the award of a graduate or post-graduate degree from a recognised UK university or during study for a post-graduate degree. Work undertaken for a BSc or MEng will not be eligible.
- Have at least reached a stage where a prototype has been developed or proof of concept demonstrated, and there is an expectation that the technology will be developed commercially. The results of laboratory based research will not of themselves be sufficient to qualify for the Award.

The Prize

The Award comprises a cash prize of up to £5,000, an engraved medal and a certificate, which will be presented at the Worshipful Company of Engineers Annual Awards Dinner in July. The cash is to be used in furtherance of the winner's career, such as educational overseas travel, and the winner will be expected to submit a short report, which may be published, on how the money has been used.

The Process

Written submissions (preferably by email) should be made by **Wednesday 18 May 2016**, by completing the attached form (copy available at: www.engineerstrust.org.uk), accompanied by a report of no more than 1,000 words in English, together with diagrams, if appropriate. The submission should demonstrate how the development has, or would, make positive improvements to the environment, and must be certified by a director or senior manager of the organisation to endorse that the candidate did make the contribution claimed.

Following receipt of submissions, a short list of candidates will be selected and individuals will be required to attend an interview (on **Tuesday 31 May 2016**) and make a 15 minute presentation to be followed by questions posed by an Award Interview Panel. The winner will be notified after all presentations have been assessed, and the award will be presented at the Company's Annual Award ceremony, on **Tuesday 19 July 2016**, when the winner will be invited to dine with the Company.

The Company will require the right to publish the winning submission in its in-house journal and to provide it to sponsoring organisations.

Previous Winners

2015: Alister Smith, of Loughborough University has developed “**acoustic emission monitoring for landslide early warning**”, a means of early warning of landslides through detecting accelerations of slope movement, continuously and in real-time, by quantifying slope deformation behaviour using acoustic emission monitoring. Field trials in the UK, Italy and Canada have demonstrated proof of concept and discussions have started to commercialise the approach. This has made a significant contribution to the ALARMS (Assessment of Landslides using Acoustic Real-time Monitoring Systems) project, led by Professor Neil Dixon at Loughborough University.

2014: Dr Thomas Povey, working at the Thermofluids Laboratory, University of Oxford he studied the heat transfer of cooking pans and as a result of his research has developed a striking new pan design which is very much more efficient than conventional pans when cooking on gas stoves. Pans manufactured to be suitable for consumer use outperform conventional pans by up to 40% in terms of overall efficiency. The pan has an integral external heat exchanger which extracts otherwise waste heat from the hot plume, resulting in greater efficiency of energy transfer to the contents of the pan. In addition to penetrating the hot waste gas, the heat exchange acts to stabilise the flame giving rise to improved flow of hot gas over the gas-washed surfaces of the pan. In a collaboration with Lakeland (UK) and Nordicware (USA), the pan was launched as a consumer product in July 2014.

2013: Caroline Hepburn for her work on “Online measurement of siloxanes by Fourier Transform Infrared (FTIR) spectroscopy: A new tool for enhancing engine protection during energy production from biogas”, the 2013 Hawley Award goes to Caroline Hepburn, of Cranfield Water Science Institute. Biogas from sewage contains siloxanes which damage the CHP engines

used for energy generation. Activated carbon beds are used to remove the siloxanes, but current monitoring techniques delay warning of bed saturation and siloxane breakthrough for up to six days. Caroline has developed the use of FTIR to monitor siloxanes, which provides immediate results, resulting in significant cost savings in engine maintenance and repair.

2012: Mr Christopher Vagg, of Bath University, working with Ashwoods Automotive Limited, for his development of a driver advisory tool that reduces fuel consumption in light commercial vehicles

2010: Mr Robert Matthews, conducting research for the Aquatest Research Programme at the Water and Health Research Centre, University of Bristol, for developing a low-cost device to help to improve the effectiveness of water-quality testing.

2009: Helen Bailey, of Aggregate Industries, for her paper on the use of waste vegetable oil as a bitumen replacement in asphalt mixtures.

2008: Mr John Robinson, for a paper that described a low cost and environmentally beneficial solution to the treatment of oil contaminated drill cuttings, of particular value to offshore oil and gas platform operations.

2007: Dr William Mayes of Newcastle University, for a paper on the use of wetlands for the treatment of highly alkaline leachates.
